Note. Scores are equal-novel means of complete-sentence sentiment values for sentences in which the listed verb occurred as the predicate of a gendered subject in the specified corpus and stage. Identical sentences were counted once per verb within each novel. Novel–verb combinations with no qualifying occurrence were treated as missing rather than assigned zero. AFINN is the primary sentiment measure; NRC, SentiStrength, and SentiWordNet are sensitivity measures. Their absolute values are not directly comparable because the methods use different native scales.
